	TERMS USED	IN THIS REPORT:				
level of a contaminar water. Primary MCLs MCLGs) as is econ feasible. Secondary M taste, and appearance o Maximum Contaminal level of a contaminant there is no known or e are set by the U.S. Er (USEPA). Public Health Goa	ant Level Goal (MCLG): The in drinking water below which expected risk to health. MCLGs wironmental Protection Agency 1 (PHG): The level of a	Primary Drinking Water Standards (PDWS): MCLs and MRDLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements. Secondary Drinking Water Standards (SDWS): MCLs for contaminants that affect taste, odor, or appearance of the drinking water. Contaminants with SDWSs do not affect the health at the MCL levels. Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water. Regulatory Action Level (AL): The concentration of a contaminant which, if exceeded, triggers treatment or other				
known or expected rish California Environment Maximum Residual The level of a disinfet that may not be exceed Maximum Residual Residual	Disinfectant Level (MRDL): ctant added for water treatment led at the consumer's tap.	requirements that a water system must follow. Variances and Exemptions: Department permission to exceed an MCL or not comply with a treatment technique under certain conditions. ND: not detectable at testing limit ppm: parts per million or milligrams per liter (mg/L) ppb: parts per billion or micrograms per liter (ug/L)				
treatment below which	there is no known or expected RDLGs are set by the U.S.	114-16-17				

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, Frazier Mtn. Highs, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturallyoccurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

pCi/L: picocuries per liter (a measure of radiation)

MRDLGs are set by the U.S.

risk to health.

Environmental Protection Agency.

Revised Jan 2012 2011 SWS CCR Form

Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic systems.
- Radioactive contaminants, that can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the USEPA and the state Department of Public Health (Department) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. Department regulations also establish limits for contaminants in bottled water that must provide the same protection for public health.

The attached tables list all of the drinking water contaminants that were detected during the most recent sampling for the constituent. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. The Department allows us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of the data, though representative of the water quality, are more than one year old.

TABLE 1 - S	SAMPLING	RESULTS	SHOWING TH	IE DETECTI	ON OF	COLIFORM BACTERIA
Microbiological Contaminants (to be completed only if there was a detection of bacteria)	Highest No. of detections	No. of months in violation	MCL		melg	Typical Source of Bacteria
Total Coliform Bacteria	(In a mo.) <u>0</u>	Q	More than 1 sample in a month with a detection		0	Naturally present in the environment
Fecal Coliform or E. coli	(In the year)	0	A routine sample and a repeat sample detect total coliform and either sample also detects fecal coliform or E. coli		0	Human and animal fecal waste
TABLE 2	- SAMPLIN	G RESUL	rs showing	THE DETEC	TION (OF LEAD AND COPPER
Lead and Copper (to be completed only if there was a detection of lead or copper in the last sample set)	No. of samples collected	90 th percentile level detected	No. sites exceeding AL	AL	PHG	Typical Source of Contaminant
Lead (ppb) (Done in 2011)	10	0.0082	0	15	2	Internal corrosion of household water plumbing systems; discharges from industrial manufacturers; erosion of natural deposits
Copper (ppm) (Done in 2011)	10	0.0058	0	1.3	0.17	Internal corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives
	TABLE 3	- SAMPLI	NG RESULTS	FOR SODIUI	M AND	HARDNESS
Chemical or Constituent (and reporting units)	Sample Date	Level Detected	Range of Detections	MCL	PHG	Typical Source of Contaminant
Sodium (ppm)	1995	6		none	none	Generally found in ground & surface water
						Generally found in ground & surface water

^{*}Any violation of an MCL or AL is marked with an asterisk. Additional information regarding the violation is provided later in this report.

TABLE 4 - DET	ECTION OF	CONTAMI	NANTS WIT	H A <u>PRIM</u>	<u> RY</u> DRINKI	ING WATER STANDARD
Chemical or Constituent (and reporting units)	Sample Date	Level Detected	Range of Detections	MCL [MRDL]	PHG (MCLG) [MRDLG]	Typical Source of Contaminant
Gross Alpha (pCi/L)	2011	15.1		15	(0)	Erosion of natural deposits
Uranium (pCi/L)*	Quarterly	17.75	16-20	20	0.43	Erosion of natural deposits
Barium (ppb)	2010	.031		1	2	Erosion of natural deposits
Chromium (ppb)	2010	ND		50	(100)	Erosion of natural deposits
Fluoride (ppm)	2010	1.8		2	1	Erosion of natural deposits
Nitrate (ppm)*	Quarterly	23.75	21-29	45	45	Erosion of natural deposits; leaching from fertilizer use and septic systems
Nitrite (ppm)	2009	0.024		1	1	Erosion of natural deposits; leaching from fertilizer use and septic systems
TABLE 5 - DETI	ECTION OF C	ONTAMIN	IANTS WITH	I A <u>SECON</u>	DARY DRIN	KING WATER STANDARD
Chemical or Constituent (and reporting units)	Sample Date	Level Detected	Range of Detections	MCL	PHG (MCLG)	Typical Source of Contaminant
Aluminum (ppb)	2010	ND		200	N/A	Erosion of natural deposits
Chloride (ppm)	1995	17		500	N/A	Runoff from natural deposits
Color (units)	1995	0.64		15	N/A	Naturally occurring organic material
Sulfate (ppm)	1995	156		500	N/A	Runoff/leaching from natural deposits
TDS (ppm)	1995	480		1500	N/A	Runoff/leaching from natural deposits
Turbidity (NTU units)	1995	0.64		5	N/A	Soil runoff

^{*}Any violation of an MCL, MRDL, or TT is asterisked. Additional information regarding the violation is provided later in this report.

Additional General Information on Drinking Water: Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the USEPA's Safe Drinking Water Hotline (1-800-426-4791). Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

*Nitrate: in drinking water above 45 mg/L (ppm) is a health risk for infants of less than six months of age. Such nitrate levels in drinking water can interfere with the capacity of the infant's blood to carry oxygen, resulting in serious illness; symptoms include shortness of breath and blueness of the skin. Nitrate levels above 45 mg/L may also affect the ability of the blood to carry oxygen in other individuals, such as pregnant women and those with specific enzyme deficiencies. If you are caring for an infant, or you are pregnant, you should ask advice from your health care provider. Nitrate levels may rise quickly for short periods of time because of rainfall or agricultural activity.

*Uranium: Some people who drink water containing uranium in excess of the MCL over many years may have kidney problems or an increased risk of getting cancer.

Lead: Infants and young children are typically more vulnerable to lead in drinking water than the general population. It is possible that lead levels at your home may be higher than at other homes in the community as a result of materials used in your home's plumbing. If you are concerned about elevated lead levels in your home's water, you may wish to have your water tested and/or flush your tap for 30 seconds to 2 minutes before using tap water. Additional information is available from the USEPA Safe Drinking Water Hotline (1-800-426-4791).
